

Progress Report

April - December 2025

Centers for Disease Control

Agency Pledge

The CDC has made no official pledge to replace animal testing and research with human-relevant methods and models. NAVS will push for such a pledge.

November 2025

CDC ends monkey testing

The agency directed its researchers to end all research involving monkeys by the end of 2025.

Where CDC Progress Falls Short

- Progress to date applies only to nonhuman primates, leaving most animals used by CDC researchers (including mice, rats, and other species) entirely unaddressed.
- The CDC has not specified what will happen to the approximately 200 monkeys currently housed at its Atlanta campus, including whether they will be sent to sanctuaries, transferred to other laboratories, or euthanized.

How NAVS is Helping the CDC Move Away from Animal Use

- Sanctuary grants: Through our Animal Sanctuary Assistance Program (ASAP), NAVS helps build capacity at accredited sanctuaries to receive and care for monkeys that are no longer being used in research and testing.
- Support through policy change: NAVS' support for the Captive Primate Safety Act would reduce pet primate surrenders, freeing up sanctuary space to receive nonhuman primates retired from the CDC and other government funded research.
- Shifting federal investment: NAVS advocates for funding decisions that prioritize NAMs development, training, and regulatory science over maintaining animal-based systems.
